

SETUP

1 Open the Runtime Scriptable Edit Window

- Open the tool from the Unity menu:
- Tools → RuntimeScriptableEdit → Runtime Scriptable Edit Window

2 Create a Profile

- Create a Runtime Scriptable Edit Profile asset:

Right Click → Create → Config → Runtime Scriptable Edit Profile

3 Assign ScriptableObjects

- Assign the ScriptableObjects you want to edit to the **Runtime Scriptable Edit Profile**.

4 Assign Profile to the Window

- Assign the **Runtime Scriptable Edit Profile** to the **Runtime Scriptable Edit Window**.

Play Mode Editing

Modify values from “**Runtime Scriptable Edit Window**” while the game is running.

Changes are reflected immediately after clicking “**Temporary Apply**”.

And saved immediately after clicking “**Permanent Save**”.

Temporary Apply

- Values are applied during Play Mode
- Changes are *not saved*
- *Revert* restore to original values

Permanent Save

- Values are *saved permanently*
 - Changes *persist after Play Mode*
-

Important Note

- Permanent changes behave exactly the same as editing ScriptableObjects in the Inspector.
- Take your save before editing ;)

Disclaimer

For the **Runtime Scriptable Edit** system to function correctly, your scripts must access data directly from the ScriptableObject.

The Caching Trap: The most common mistake is "caching" a value into a local variable before using it. If you do this, the local variable holds the *old* value, and the changes you make in the Runtime Window won't be reflected until the next time that variable is assigned.

The Correct Way: Always pass the ScriptableObject field directly into your functions or logic. This ensures that every time the code runs, it pulls the most up-to-date value currently set in the tool.

Method	Code Example	Why?
 Wrong	<pre>const float jump = mySO.jumpForce; Apply(jump);</pre>	The local jump variable won't update if you change the SO during runtime.
 Correct	<pre>Apply(mySO.jumpForce);</pre>	The code pulls the "live" value directly from the SO asset every frame.
